Dear Crash Data Researchers/Users:

Thank you for choosing crash data from the National Highway Traffic Safety Administration (NHTSA) for your research or other use. The information contained in this motor vehicle crash report is collected, maintained and distributed in accordance with Public Law 89-564. In accordance with this Public Law, NHTSA is required not to release any case information until completion of quality control procedures. These procedures include a review of the case material to extract all names, licenses and registration numbers, non-coded interview material, non-research related researcher comments in the margins, non-factual data, and the production number portion of the vehicle identification number (VIN).

If you requested NHTSA to query its database files in order to identify a specific crash, then that query was made using non-personal descriptors you provided for use in our search. This motor vehicle crash may have been identified from a data search and matches the general, non-personal descriptors you provided, but we cannot confirm that this is the specific crash report you requested.

If you have any questions with regard to the above procedures, please contact the Field Operations Branch, Crash Investigation Division, National Center for Statistics and Analysis at 202-366-4820. Again, please be advised that we cannot confirm that this is the case that you have specifically requested nor can we certify the information to be correct.

## **TECHNICAL SUMMARY**

**CONTRACTOR:** Dynamic Science, Inc.  
**CONTRACT NUMBER:** DTNH22-94-D-27058  
**CASE NUMBER:** Case DSI-95-AB-024

This case initiated in response to a report that the airbag in this vehicle did not fully deploy or did not deploy properly.

This single vehicle collision occurred during the mid-afternoon hours of a fall weekday. The weather was clear and the roadway was dry.

Vehicle 1 was a 1995 Mazda Miata being driven by a 24-year-old female. The driver had just completed some business at a shopping center bank. To exit the shopping center, the driver would have had first to drive south for approximately 105 m (345 ft), then west for approximately 35 m (115 ft) until reaching a three-leg, signaled intersection.

According to the driver, as Vehicle 1 was traveling south it bottomed out on a rain gutter. This swail was 33 m (107 ft) from the bank exit. It is 83 cm wide, 4 cm at its deepest point, and it extends across the entire roadway. Vehicle 1 continued on, turning right to go west. The vehicle entered the intersection on a green light and was in the process of turning left when the airbag partially deployed. This caused the driver to lose control and mount the center median.

The on-scene inspection of the scene and the case vehicle describe a different set of events in this case than those provided by the driver. There is no evidence, on the vehicle or on the road surface, that the vehicle bottomed out on the rain gutter. The damage sustained by Vehicle 1 is entirely consistent with a typical undercarriage airbag-deploying impact. There is clear evidence within the vehicle which points to a full deployment (i.e., airbag contact with the driver's side visor).

It is the opinion of this investigator that the driver of Vehicle 1 entered the intersection attempting to turn south. The driver turned too soon and overrode/impacted the center median at an approximate speed of 40 km/h (21 MPH). The airbag deployed at this time. The driver sustained contusions/swelling to both hands due to contact with the deploying airbag. Vehicle 1 came to rest on the median. The driver was not treated at the scene, but did later see a private physician. A bystander moved Vehicle 1 by driving it over the median. The deployed airbag was folded back into the module and it was taped down using gray duct tape. The vehicle has since been driven to a Mazda repair shop.

*The opinions, findings, and conclusions expressed in this publication are those of the authors and not necessarily those of the National Highway Traffic Safety Administration.*

*The crash investigation process is an inexact science which requires that physical evidence such as skid marks, vehicular damage measurements, and occupant contact points be coupled with the investigator's expert knowledge and experience of vehicle dynamics and occupant kinematics in order to determine the pre-crash, crash, and post-crash movements of involved vehicles and occupants.*

*Because each crash is a unique sequence of events, generalized conclusions cannot be made concerning the crashworthiness performance of the involved vehicle(s) or their safety systems.*

Calculate speed from stop at intersection to impact with median using 4 ft/sec/sec as an acceleration rate.

$$S = \sqrt{2aD}$$

where

$S$  = speed after acceleration

$a$  = acceleration rate

$D$  = distance

Substituting/solving:

$$S = \sqrt{2 * 4 * 56} = 21.1 \text{ MPH} = 33.9 \text{ KPH}$$

**COLLISION SEQUENCE:**

**Pre-Crash:** This single vehicle collision occurred during the mid-afternoon hours of a fall weekday. The weather was clear and the roadway was dry.

Vehicle 1 was a 1995 Mazda Miata being driven by a 24-year-old female. The driver had just completed some business at a shopping center bank. To exit the shopping center, the driver would have had first to drive south for approximately 105 m (345 ft), then west for approximately 35 m (115 ft) until reaching a three-leg, signaled intersection.

**Crash:** According to the driver, as Vehicle 1 was traveling south it bottomed out on a rain gutter. This gutter was 33 m (107 ft) from the bank exit. It is 83 cm wide, 4 cm at its deepest point, and it extends across the entire roadway. Vehicle 1 continued on, turning right to go west. The vehicle entered the intersection on a green light and was in the process of turning left when the airbag partially deployed. This caused the driver to lose control and mount the center median.

The on-scene inspection of the scene and the case vehicle describe a different set of events in this case than those provided by the driver. There is no evidence, either on the vehicle or on the road surface, that the vehicle bottomed out on the rain gutter. The damage sustained by Vehicle 1 is entirely consistent with a typical undercarriage airbag-deploying impact.

There is clear evidence within the vehicle which points to a full deployment (i.e., airbag contact with the driver's side visor).

Based upon the available evidence, it is the opinion of this investigator that the driver of Vehicle 1 entered

the intersection attempting to turn south. The driver turned too soon and overrode/impacted the center median at an approximate speed of 33.9 km/h (21.1 MPH). The airbag deployed at this time. Vehicle 1 came to rest on the median. The driver was not treated at the scene, but did later see a private physician.

- Post Crash:** A bystander moved Vehicle 1 by driving it over the median. The deployed airbag was folded back into the module and it was taped down using gray duct tape. The vehicle has since been driven to a Mazda repair shop.
- Occupant Kinematics:** The driver of Vehicle 1 was sitting in a normal, upright position. Her right foot was on the accelerator; her left on the floorboard. Both hands were on the steering wheel, generally in the 5 and 7 o'clock positions. At impact, the driver went forward slightly. There were no visible contacts to the airbag. As the airbag deployed, it appears that the driver's left hand was struck by the airbag and right possibly by both the lower module cover and the airbag. The driver sustained contusions/swelling to both hands.
- Supplemental Restraint System:** Vehicle 1 was equipped with both a driver's side and a passenger side airbag. During the inspection of the vehicle, it was determined that the SRS light would remain lit for approximately five seconds after engaging ignition despite there having been a deployment. According to Mazda service personnel, this is a malfunction of the light.
- Scene Clearance:** Vehicle 1 was driven from its area of final rest by a passerby into a nearby parking lot. The vehicle was then driven from the scene by the driver. At some later point, the airbag was pushed back into the module and the module sealed with tape.
- Safety Standards:** There were no violations of Federal Motor Vehicle Safety Standards and Regulations found during the inspection of the case vehicle.

### CRUSH PROFILE IN CENTIMETERS

**NOTES:** Identify the plane at which the C-measurements are taken (e.g., at bumper, above bumper, at sill, above sill, etc.) and label adjustments (e.g., free space).

## UNDERCARRIAGE IMPACT

**Measure C1 to C6 from driver to passenger side in front or rear impacts and rear to front in side impacts.**

Free space value is defined as the distance between the baseline and the original body contour taken at the individual C locations. This may include the following: bumper lead, bumper taper, side protrusion, side taper, etc. Record the value for each C-measurement and maximum crush.

**Use as many lines/columns as necessary to describe each damage profile.**
